

Policy and Planning As Public Choice: Mass Transit in the United States

Under a public choice analytical framework, this book applies formal economic measures to the passenger and taxpayer benefits of public transit service in the United States. Approximately 400 local transit budgets have been renewed annually for more than 25 years. These budgets epitomize Braybrooke and Linbloms concept of disjointed incrementation and Buchanans concept of public choice since local legislators funded transit despite constant academic criticism of transit performance. On the other hand, Braybrooke and Lindblom and Buchanan show that local budgets capture benefits that traditional planning analysis does not grasp. This is borne out in analysis in the book. Indeed, far from draining society, transit returns five dollars in benefits for each one dollar of public subsidy. After explaining the analytical framework in chapter one, four chapters are devoted to measuring the value of transit benefits. The concluding chapter draws out the implications of this approach and of benefit measurement for policy and planning.
